Manufacturing Award Winning Solutions for GC Analysis

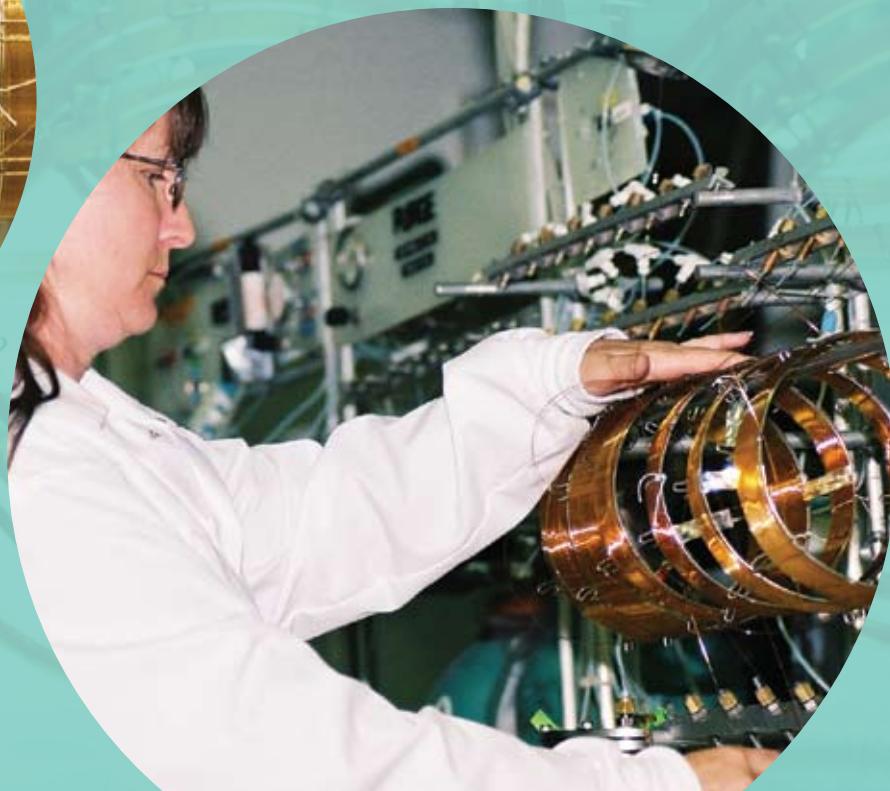

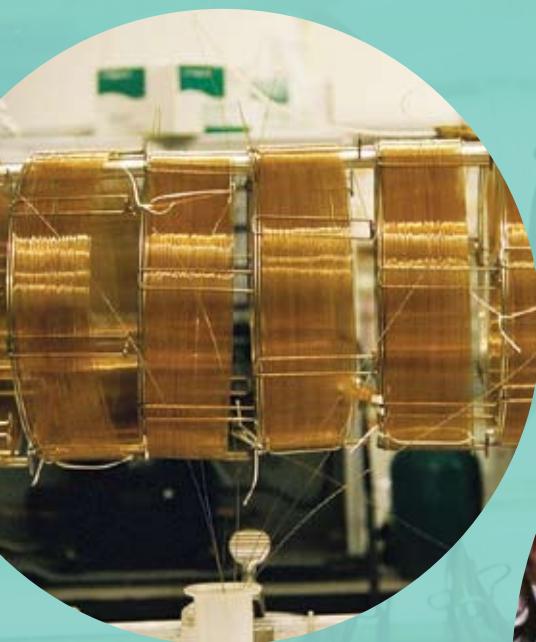

In the field of gas chromatography, not much has changed in the last 15 years. However, technology is our passion and Phenomenex is gaining international recognitions for its GC products that are specially designed for today's most challenging methods.

For chemists struggling with high boilers, contaminants, or carry-overs, Phenomenex developed the Zebron™ Inferno™ line. This line of GC columns have revolutionized GC analysis by allowing chemists to run their analysis at oven temperatures that were never before attainable - all without having to use a metal column!

The Zebron ZB-1HT and ZB-5HT Inferno columns are rugged, mid-polarity columns that allow chemists to push their standard analysis up to 430 °C for increased lab productivity and improved performance. The newly developed Zebron ZB-35HT and ZB-XLB-HT Inferno columns provide high temperature capability up to 400 °C for those using more polar columns.

Challenges with Traditional GC Columns

Standard fused silica columns - Shorter lifetime

Unlike the Zebron™ Inferno™ GC columns, most fused silica columns are not developed to handle prolonged exposure to temperatures above 360 °C.

At high temperatures, fused silica GC columns:

- Become inflexible and brittle
- Break easily and are costly to replace
- Require more system downtime to replace columns
- Can't separate high molecular weight compounds

Deterioration of a standard column at high temperatures

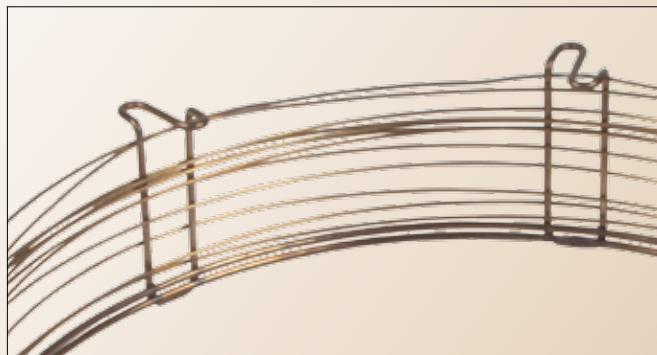

Metal columns – Difficult to use

Though metal columns have higher temperature limits than capillary columns, they are more difficult to use.

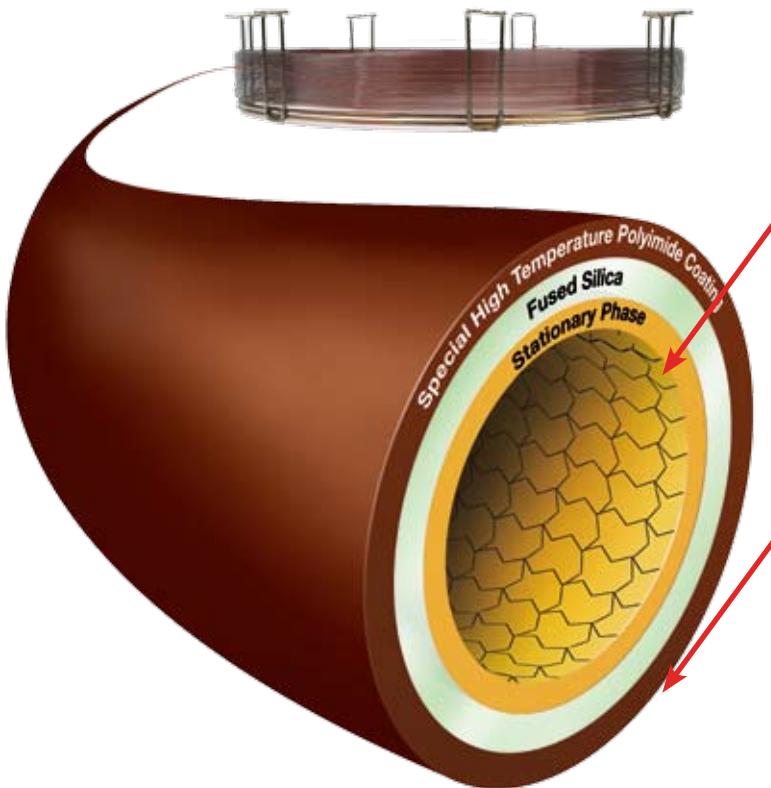

Metal columns:

- Inflexible and hard to use
- Require special tubing cutters for installation
- Prone to leaks from expansion and contraction
- Have active surface, giving poor peak shapes for acids and bases
- Incompatible with MS detectors

Advanced Solutions for High Temperature Analysis

Zebron™ Inferno™ columns offer enhanced performance where other columns fail. The two critical factors that allow for this are:

1. Advanced ESC™ Bonding Technology

At high temperature ranges, the stability of standard GC columns will deteriorate, resulting in increased bleed. Zebron's Engineered Self Cross-linking™ (ESC) bonding technology reinforces the stationary phase for enhanced column durability and extremely low bleed levels. The result - our Inferno columns allow for the flexibility to perform GC analysis at high temperatures while providing low bleed and longer column lifetime.

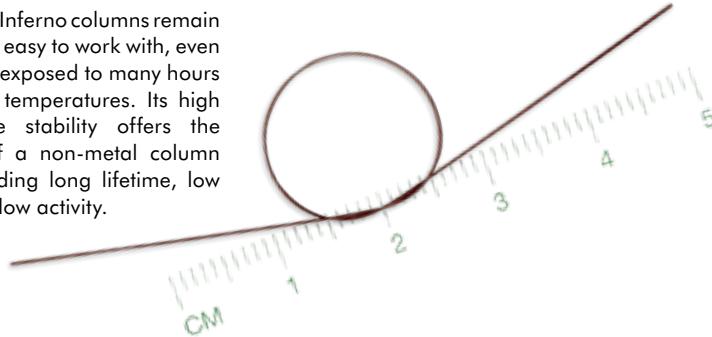

2. Special High Temperature Polyimide Coating

Standard polyimide resin pyrolyzes at temperatures above 360 °C, making the tubing unstable. The Zebron Inferno columns utilize a special dark polyimide resin that shows minimal thermal degradation even at temperatures up to 430 °C.* This results in longer column lifetime at elevated temperatures.

Phase	Temperature Limit
ZB-1HT	430 °C
ZB-5HT	430 °C
ZB-35HT	NEW! 400 °C
ZB-XLB-HT	NEW! 400 °C

Flexible Even at 430 °C!**

The Zebron Inferno columns remain flexible and easy to work with, even after being exposed to many hours at extreme temperatures. Its high temperature stability offers the flexibility of a non-metal column while providing long lifetime, low bleed, and low activity.

* Zebron ZB-1HT and ZB-5HT Inferno columns have an upper temperature limit of 430 °C. Zebron ZB-35HT and ZB-XLB-HT Inferno columns have an upper temperature limit of 400 °C.

** Evaluated by performing 185 programmed temperature runs, total 23 hours at 430 °C. Polyimide tubing was still flexible as shown here.

Extremely Low Bleed for Rugged Performance

- Longer column lifetime
- Better reproducibility
- Maximum sensitivity
- Accurate quantitation

What is column bleed?

Column bleed is the loss of stationary phase as a result of impurities in the starting polymer or the decomposition of the phase at elevated temperatures.

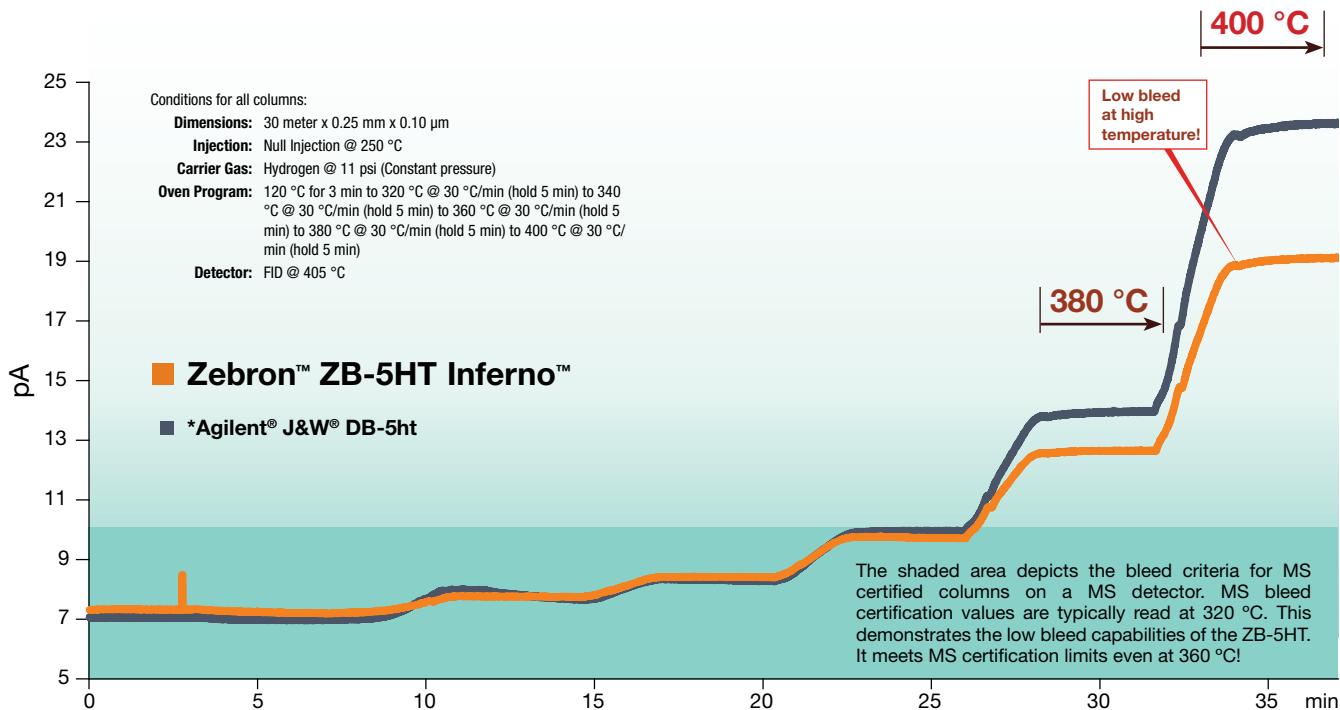

Why is column bleed undesirable?

Column bleed can be an indicator of the stability and lifetime a GC column will offer. When using sensitive detectors such as MS, bleed can impact method detection limits (MDLs) causing difficulties at the low calibration ranges.

What sets Zebron's bleed apart from others?

Our proprietary ESC™ bonding technology and special polyimide tubing provides enhanced column durability for extremely low bleed levels.

Zebron™ Inferno™ Columns Have Lower Bleed than Other Manufacturers[†]

[†] All columns were new, never used, prior to this testing. Columns were purchased either directly from the original manufacturer or through an authorized distributor. All testing was carefully controlled to ensure conditions were similar for all columns involved. The comparative data is not representative of every application.

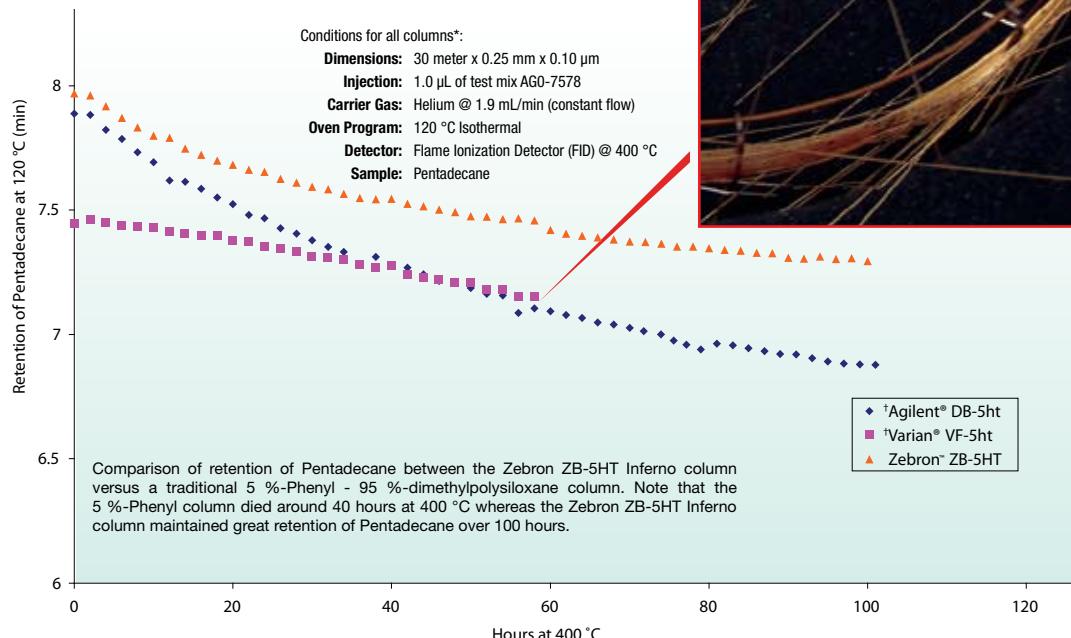

Zebron™ Inferno™'s High Durability Provides Increased Column Lifetime

- Less instrument downtime
- More productivity
- Lower laboratory costs

Standard GC Columns Cannot Withstand High Temperature

After prolonged exposure to temperatures above 360 °C, most traditional GC columns become brittle and inflexible, often spontaneously breaking in the middle of a run. Work is stopped in order to change out the column and perform system maintenance. Unlike these fragile columns, the Zebron Inferno columns have a special polyimide coating that provides longer column lifetime at temperatures up to 430 °C. As a result, you will experience longer column lifetime, less instrument downtime, and higher productivity.

Zebron Inferno Columns Win In The Lifetime Test

*All columns were new, never used, prior to this testing. Columns were purchased either directly from the original manufacturer or through an authorized distributor. All testing was carefully controlled to ensure conditions were similar for all columns involved. The comparative data is not representative of every application.

How does the lifetime test work?

Hydrocarbons are a good way to measure the stability and lifetime of a non-polar column. Because its interaction with the phase is mostly based on London Dispersion forces, any change in retention time is correlated with phase loss. This will result in increased bleed and poor reproducibility.

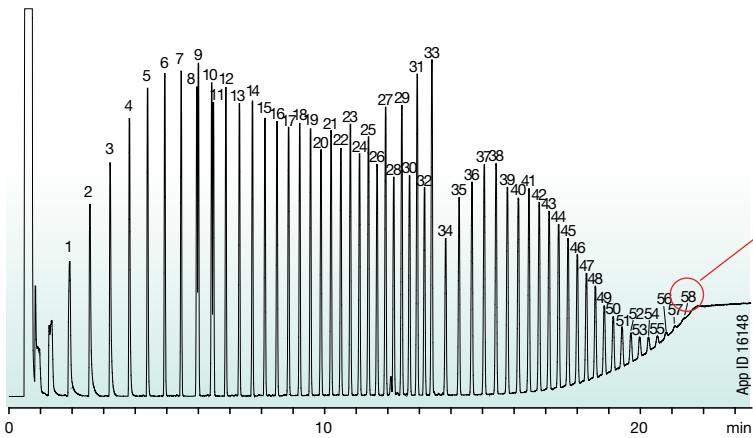

In the lifetime study above, the Zebron ZB-5HT Inferno column has twice the lifetime as the two comparative columns. For the test, all columns were held at 400 °C for 2 hours and then the oven was lowered to 120 °C for Pentadecane analysis. The Varian® HT column broke just after 40 hours at 400 °C. The Agilent® J&W® DB-5ht column had the same retention for Pentadecane at 40 hours as the ZB-5HT at 100 hours.

Greater Performance for High Boiling Compounds

- Better peak shape
- Improved separation
- More analytes detected

Zebron™ Inferno™ GC columns have the inertness and temperature stability needed for separating high molecular weight compounds. These high boiling compounds require a thermally rugged column with low bleed levels. Zebron Inferno columns have the high temperature stability and durability to provide optimal separation of these compounds.

Bake-off Contaminants and Eliminate Carry-overs!

- Achieve better reproducibility
- Extend column lifetime
- Attain sharper peak shapes

Eliminate Problems Associated with Dirty Samples

Dirty samples can linger on a GC column, eventually changing the selectivity and shortening the lifetime of a column. Since Zebron™ Inferno™ columns have extremely high temperature limits, it allows for the use of more aggressive column baking steps to remove persistent contaminants, thus prolonging column lifetimes.

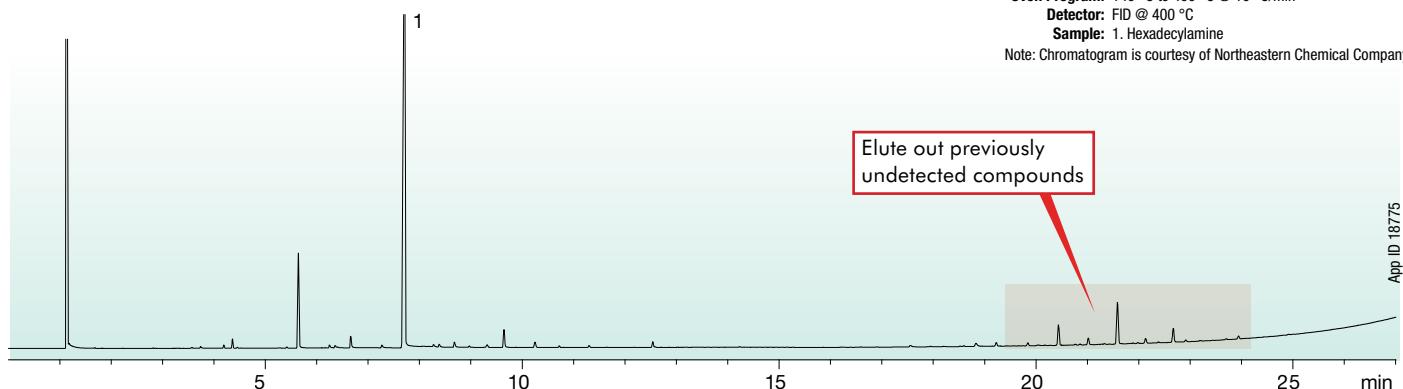

See What You have been Missing!

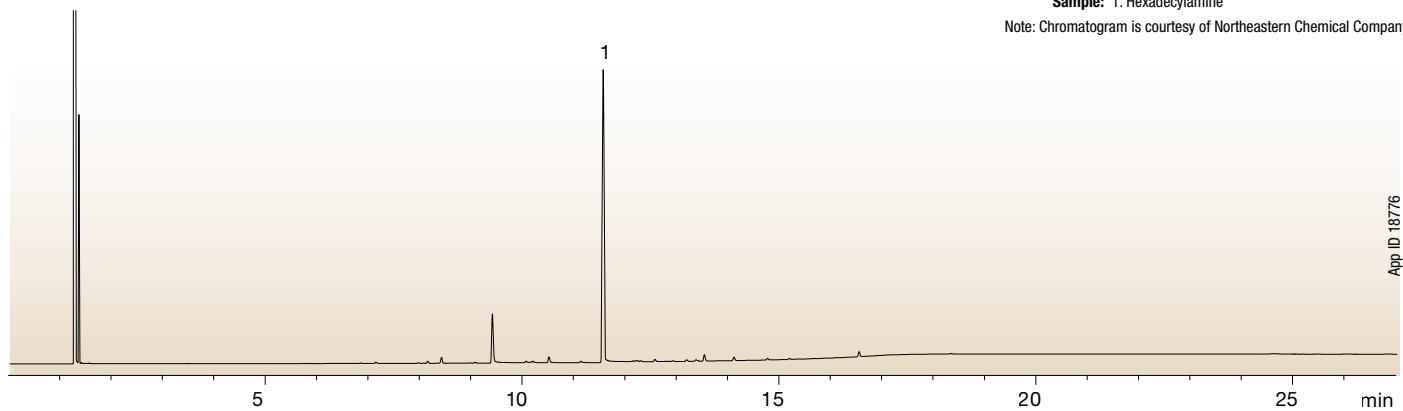

- Uncover compounds that were previously undetected
- Elute compounds at higher temperatures
- Achieve more accurate, reproducible results

Many high boiling compounds will stay on a column and go undetected run after run. As a consequence, results are inaccurate because of missing data. Running at higher temperatures will allow these formerly undetected compounds to elute and be detected, giving more accurate and reproducible results.

Two New Innovative Mid-Polar Phases:

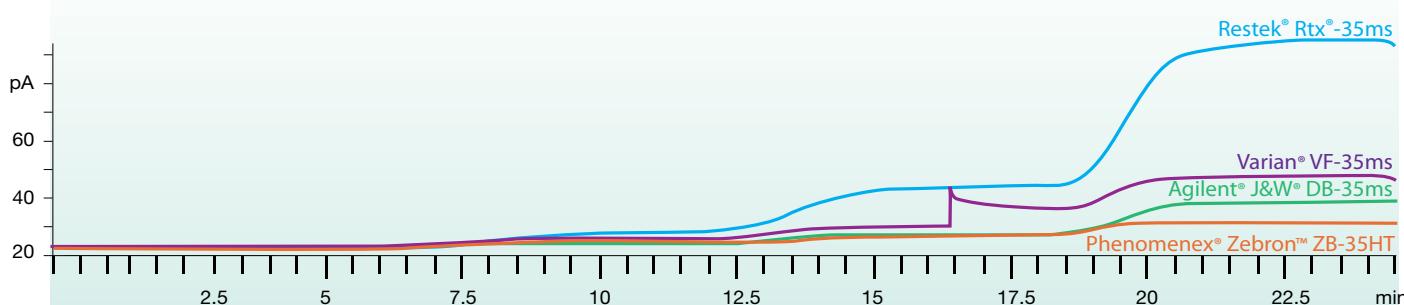

Zebtron™ ZB-35HT and ZB-XLB-HT Inferno™

Unlike standard mid-polar GC columns that fail at high oven temperatures, the NEW Zebtron ZB-35HT and ZB-XLB-HT Inferno columns have the durability and ruggedness to perform well at extreme temperatures. With an astonishing upper temperature limit of 400 °C, both columns will provide the separation of high boiling compounds at extremely low bleed levels.

PolyBrominated Diphenyl Ethers (PBDE)

In a GC column, late eluting PBDEs often break down and become difficult to detect. The Zebron™ Inferno™ columns have increased sensitivity for late eluting compounds and thus can easily detect these analytes.

Column: Standard 5-type phase
Dimensions: 15 meter x 0.25 mm x 0.10 µm

ASTM Methods D2887 and D6352 on One Column

ASTM D2887 and D6352 both set standard test methods for boiling range determination of petroleum fractions by GC. While ASTM D2887 is used for products having a final boiling point of 538 °C or lower, ASTM D6352 is used for determining petroleum distillate fractions with a boiling point (BP) up to 700 °C. The Zebtron Inferno™ columns make

simulated distillation analysis easier and less expensive. Typically you would have to use a traditional fused silica column for ASTM D2887 and a metal column for ASTM D6352. Zebtron Inferno columns provide a robust solution for both analyses.

ASTM Method D6352

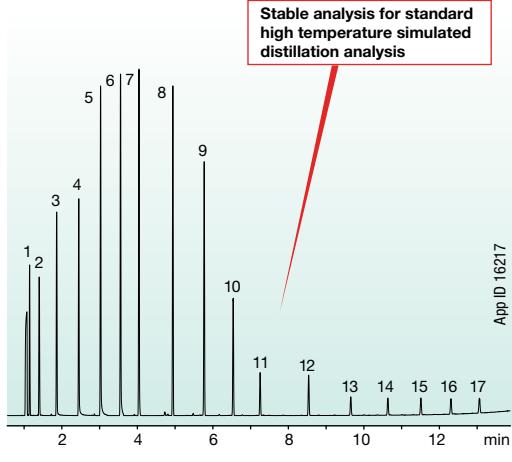

Column: Zebtron ZB-1HT Inferno™
Dimensions: 5 meter x 0.53 mm x 0.10 µm
Part No.: 7AK-G014-02
Injection: On-Column @ 43 °C, 0.1 µL
Carrier Gas: Helium @ 4.4 mL/min (constant flow)
Oven Program: 40 °C for 0.5 min to 430 °C @ 20 °C/min for 10 min
Detector: FID @ 430 °C

Note: Sample was a combination of PolyWax 655 and retention time markers C8-C40 in CS2/Chloroform.

Biodiesel Applications

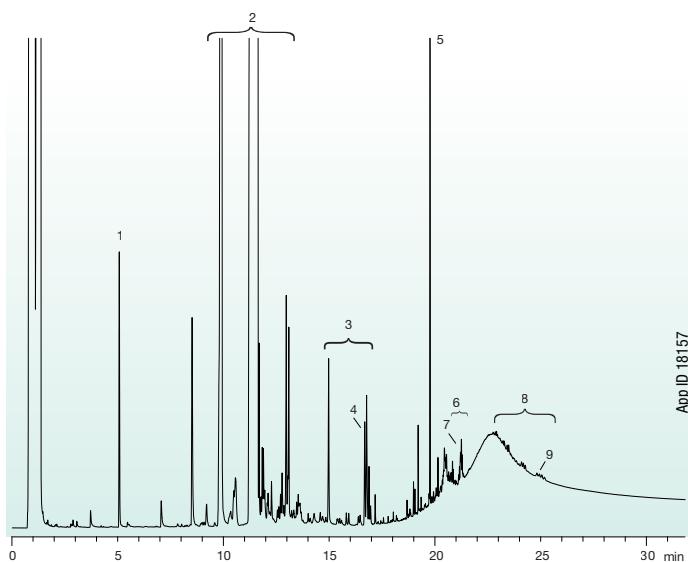

Free and Total Glycerin in Biodiesel

The Zebron™ ZB-1HT Inferno™ column is ideal for biodiesel analysis because it is stable at the elevated temperatures needed to resolve and remove high boiling triglycerides. While standard polyimide resin degrades at temperatures above 380 °C, the Inferno columns utilize a polyimide resin material that shows minimal thermal breakdown, even at programmed temperatures up to 430 °C—the highest thermal stability of any non-metal GC column!

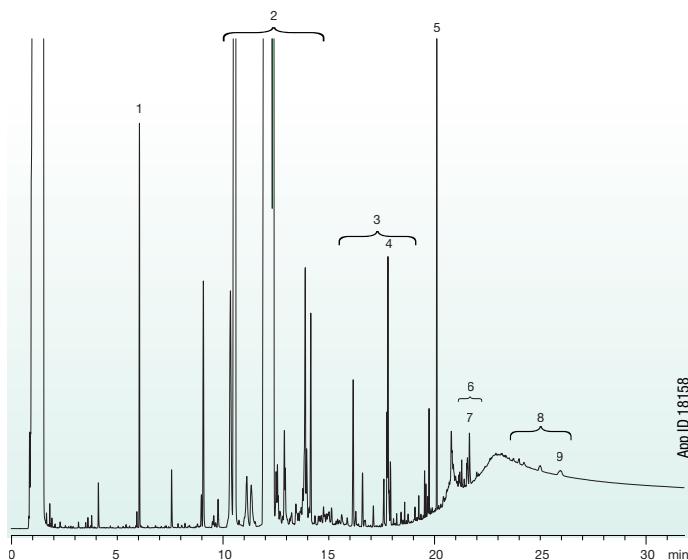

ASTM Method D6584: Free and Total Glycerin in B-100 Biodiesel Methyl Esters

Column: Zebron ZB-5HT Inferno™
Dimensions: 15 meter x 0.32 mm x 0.10 µm + 2 meter x 0.53 mm Z-Guard
Part No.: 7EM-6015-02
Injection: On-Column @ 53 °C, 1 µL
Carrier Gas: Helium @ 3.0 mL/min (constant flow)
Oven Program: 50 °C for 1 min to 180 °C @ 15 °C/min to 230 °C @ 7 °C/min to 380 °C @ 30 °C/min for 10 min

Carrier Gas: Helium @ 2 mL/min (constant flow)
Oven Program: 220 °C to 350 °C @ 15 °C/min
Detector: FID @ 350 °C
Sample: 1. Campesterol
2. Stigmastanol
3. β-Sitosterol
4. Betulin (IS)

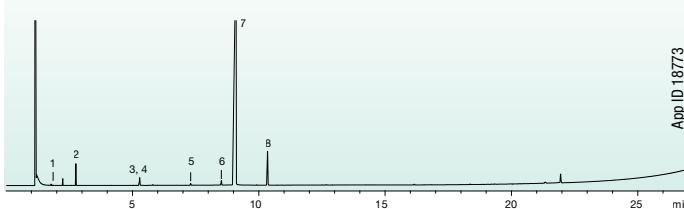

Sterols from Olive Oil: Derivatized

Column: Zebron ZB-5HT Inferno™
Dimensions: 30 meter x 0.25 mm x 0.10 µm
Part No.: 7HG-G015-02
Injection: Splitless @ 350 °C, 0.5 µL
Carrier Gas: Helium @ 2 mL/min (constant flow)
Oven Program: 220 °C to 350 °C @ 15 °C/min.
Detector: FID @ 350 °C
Note: Sterols derivatized via BSTFA:TMCS; 99:1 in pyridine
Sample: 1. Cholestanol
2. Campesterol
3. Stigmastanol
4. β-Sitosterol
5. Betulin (IS)

Cool-Lock™ Nut

Capillary GC Installation with the Cool-Lock™ Nut

- Avoid burning your fingers again – cools with the oven
- No Wite-Out® or Tipp-Ex® needed
- Achieve the proper installation depth each and every time
- No need for wrench with hand-tightened connections

1

Insert column through column nut and ferrule. Insert the end of the column and column nut into the bottom of the Cool-Lock Nut Installation Gauge.

2

Hand-tighten the column nut into the gauge until the ferrule starts to compress. Adjust the length of the column to the desired length.

3

Unscrew the installation gauge and install the nut and column into the instrument.

4

Make sure Cool-Lock nut is in the full extension position to achieve the correct pre-measured position, and allow for proper leak checking.

Injection Port Inlet Liners

- Fit standard instrument manufacturers' inlets
- Popular designs at excellent prices
- Reduce analyte discrimination
- Improve reproducibility and results
- Clean, non-adsorptive/non-reactive surface

Septa

Silicone Rubber Inlet Septa

- Advanced silicone formulations reduce coring and increase septum lifetime
- Enhanced durability and re-sealing capabilities
- Precision formed and cut to exacting specifications
- Reduced needle damage
- General purpose and specialty low bleed, high-temperature septa available

PhenoRed™ -400

Fire brick red, with a 50 durometer rating, this specially formulated high-temperature, low-bleed silicone rubber septum is designed and conditioned for high sensitivity analysis where the demands for low bleed and heat stability are critical. Say goodbye to ghost peaks! Temperature-rated to 400 °C.

PhenoGreen™ -400

Long life, high-temperature green septum, rated to 400 °C. GuideRight™ through-hole to guide the needle during injection.

Ordering Information Silicone Rubber Septa

Part No.	Description	Unit	Price
PhenoRed 9/16 in. (9.5 mm) Diameter			
AGO-4690	PhenoRed-400 Injector Septa	50/pk	
AGO-4691	PhenoRed-400 Injector Septa	100/pk

AGO-4696	PhenoRed-400 Injector Septa	50/pk	
AGO-4697	PhenoRed-400 Injector Septa	100/pk	

GuideRight™ Injection Hole Septa

The GuideRight™ through-hole guides the needle during injection. Septum performance and lifetime increase while downtime due to bent needles or dirty injection ports decreases. Choose from either high-temperature PhenoGreen™ or PhenoRed™, both rated to 400 °C.

Long Ferrules

Graphite Ferrules

- High-purity graphite significantly reduces ferrule bleed
- Special construction minimizes "flaking"
- Stable to 450 °C - excellent for high temperature use
- Not for use with GC/MS transfer lines
